

LOUISIANA SUMMARY

AGRICULTURE & NATURAL RESOURCES

2024

Agriculture: Backbone of Louisiana's Economy

This publication tabulates the value of Louisiana agriculture in 2024. Agents and specialists of the Louisiana Cooperative Extension Service, as well as other agencies — both private and public — compiled the data. Their analysis focuses on the animal, forestry, fisheries, plant and wildlife commodities that comprise our vital agricultural industry. Agricultural and natural resource industries contribute significantly to our state's economy with the potential for increased economic benefits and job creation through value-added processing in urban and rural communities throughout Louisiana.

While the 2024 production year did not face the widespread drought and extreme heat that plagued the entire state in 2023, weather-related challenges still affected many commodities across various regions. Above-average rainfall in the central and northern parts of the state from January through April led to planting delays, forced changes in planting plans, and necessitated replanting in some areas. For most crops, summer rainfall was generally beneficial, supporting growth and development while also helping to reduce irrigation needs and related production costs. However, the increased moisture and frequent cloudy days contributed to a rise in crop disease pressure, requiring producers to invest more in pest and disease management efforts.

As the calendar turned to the harvest season, persistent rainfall that began in early summer continued across much of the state, causing harvest delays for numerous commodities. Between June and August, statewide rainfall ranged from average levels up to 49% above the 2019–2022 average. And in some areas, rainfall was two to ten times greater than what was received during the drought-stricken summer of 2023. In early September, Hurricane Francine made landfall along the eastern coast of the state, bringing heavy rainfall that further exacerbated the situation. While coastal parishes bore the brunt of the storm's impact, the rainfall extended inland, worsening harvest delays and negatively affecting crop yield and quality in the central and northeastern regions. Following the storm, the LSU AgCenter conducted a damage assessment and estimated the total economic impact to the state's agriculture sector at more than \$55 million. Notably, over 98% of that figure was attributed to just two key commodities: soybeans and sugarcane. For soybeans, although some yield losses were reported, the primary damage came from quality degradation due to prolonged harvest delays. In sugarcane, high winds and flooding caused lodging, leading to production losses and forcing some producers to replant damaged acreage. While the \$55 million in losses from excessive rainfall and Hurricane Francine was significant, it remained modest in comparison to the \$1.6 billion in economic losses caused by the widespread drought and extreme heat experienced in 2023.

While the 2024 production year marked a notable improvement over the extreme drought and heat of 2023, challenges remained. Certain regions and commodities still experienced yield and quality losses, despite overall better growing conditions. For many producers, the combination of improved weather and reduced input costs offered an opportunity for greater profitability. However, for several commodities, lower market prices eroded those potential gains. In crops like soybeans and sugarcane, adverse weather events, though more localized than in 2023, still disrupted yields and quality, limiting the extent of the recovery. Meanwhile, for crawfish, the full effects of the 2023 drought and heat were realized in 2024. The prior year's extreme conditions weakened brood stock survivability, resulting in lower production volumes and delayed harvests for many producers. In sum, 2024 brought relief in many ways, but lingering weather impacts and market pressures continued to weigh on overall agricultural recovery.

Despite the challenges faced in 2024, most commodities experienced year-over-year yield improvements compared to 2023. Among plant enterprises, all crops except sweet potatoes and wheat saw yield gains. The marginal yield declines in sweet potatoes and wheat likely reflect the fact that these crops were less affected by the 2023 drought than others. In contrast, farm-raised crawfish, while not a plant commodity, experienced a significant decline in yield. The state average

dropped by more than 37%, from 554.4 pounds per acre in 2023 to 348.3 pounds per acre in 2024. This sharp decline is attributed to reduced survivability of mature crawfish during the summer, which delayed the start of the harvest season by about a month. Typically, early-season harvests rely on these mature crawfish, but in 2024, viable harvest levels didn't materialize until new hatchlings reached marketable size.

For all other plant commodities, yields increased by 2% to as much as 58% over the previous year. Crops that saw double-digit yield increases included cotton, grain sorghum, oats, hay, peanuts and soybeans. While soybeans did suffer yield and quality losses in parts of the state due to persistent rainfall and Hurricane Francine, these impacts were far less widespread than the drought-related losses of 2023. Furthermore, although yields declined in some regions, the greater challenge in 2024 was reduced quality, which affected the prices received by producers. As a result, yield data alone does not fully reflect the struggles faced by soybean producers in 2024.

For the fisheries, wildlife, and animal enterprises, the persistent rains and Hurricane Francine were believed to have had minimal direct impacts in 2024. In the animal enterprises, the improved rainfall contributed to a significant rebound in forage and hay production compared to 2023. This increase in available feed improved overall animal performance and helped to lower supplemental feeding costs, benefiting livestock producers across the state. While Hurricane Francine did pose challenges for the fisheries sector, particularly along the eastern coast, the primary impacts were likely related to infrastructure damage and increased operational expenses — factors not captured within the scope of this publication. Although some reduced catch volumes likely occurred due to fishing limitations during and after the storm, these effects will not appear in the current report, as fishery data is reported with a one-year lag.

Another key factor limiting the ability of many commodities to show significant improvement over 2023 levels was the decline in commodity prices during the 2024 production year. Prices fell for all major row crops except for cotton, which saw a modest increase. Corn, grain sorghum, soybeans and wheat all experienced at least a 20% reduction in prices in 2024 while rice, hay and peanuts experienced a reduction of at least 10%. Even sugarcane saw lower prices as after several years of stronger raw sugar and molasses prices, prices for both fell in 2024. Raw sugar prices fell roughly 8% in 2024 while molasses prices fell by over 38%. These price declines significantly offset the gains made from improved yields and lower input costs, limiting the overall profitability improvements that many producers had hoped for in 2024.

Fishery commodity prices were also lower in 2024, contributing to the economic challenges faced by the sector. Shrimp led the declines, with prices falling 40% compared to the previous year. This continued a broader trend of increased global supply and rising imports, which have placed significant pressure on domestic shrimp prices. Other commodities that experienced reduced prices were farm raised catfish (11%), oysters (3%) freshwater fish (1%), crabs (0.5%) and wild caught crawfish (21%). The decline in wild-caught crawfish prices was particularly notable. Given the sharp drop in farm-raised crawfish production, one might have expected stronger prices for wild-caught crawfish due to reduced overall supply. There are several reasons this may have materialized. First, increased wild-caught production responding to the shortfall in farm-raised crawfish rose by nearly 24% year over year, increasing supply and likely contributing to downward price pressure. Second, the peak of farm-raised crawfish production was delayed by about a month, overlapping with the typical peak of wild-caught production. This simultaneous surge in supply from both sources likely drove prices down. Finally, crawfish demand in Louisiana traditionally peaks around Easter. However, elevated farm-raised prices during this critical demand window likely suppressed overall consumption. By the time supply levels increased significantly — from both farm-raised and wild-caught sources — seasonal demand had already begun to decline. These combined factors likely contributed to a weaker price environment for wild-caught crawfish, despite the supply challenges faced by farm-raised producers.

As previously mentioned, farm-raised crawfish prices were significantly higher in 2024, rising nearly 57% compared to 2023. This sharp increase was largely driven by later and lower overall production volumes, which tightened supply and elevated market prices. Farm-raised crawfish was not the only commodity to see higher prices in 2024. Most animal enterprises also experienced price increases, led by beef cattle and edible eggs. Edible egg prices were up nearly 45% in 2024 while the average price across all classes of cattle was up more than 28%. These strong price gains were largely a result of reduced production and inventory levels across the industry. Other animal enterprises also saw more moderate

price increases. Milk prices were up by more than 10% while broiler prices were up by a modest 2%. Other poultry enterprises (Breeder Flocks and Pullets) experienced an average increase of 25% while average sheep and swine prices were up 8% and 3%, respectively. The only notable exceptions were meat goats and cull hens. Meat goat prices declined by an average of 3%, likely due to growing inventories and increased supplies in recent years. Cull hen prices also experienced a slight decline, again mostly resulting from large supplies. These pricing trends reflect a mix of supply-driven price strength in many animal sectors, while in others, expanded inventories and supplies helped to moderate or reverse price gains.

Despite weather-related challenges and lower commodity prices for many sectors, the total gross farm value across all enterprises increased in 2024 compared to 2023. This rebound is not entirely surprising, given the severe drought impacts experienced in 2023. A more meaningful comparison may be against the previous five-year average. In 2024, the estimated total gross farm value reached \$7.40 billion, representing an 11% increase over the five-year average. Animal enterprises led this improvement, buoyed by significant price increases across most sectors. The total gross farm value for animal enterprises was estimated at \$2.08 billion, an 18% increase over the five-year average. Plant enterprises also saw gains, supported by a return to more typical production levels, even as prices declined for many commodities. The total gross farm value for plant enterprises was estimated at \$4.50 billion, up 10% compared to the five-year average. In contrast, fisheries and wildlife enterprises faced pressure from weaker prices, which offset production gains. Their total gross farm value was estimated at \$818.61 million, approximately 3% below the five-year average. These results highlight the resilience of Louisiana agriculture in 2024, with improved production conditions and stronger prices in key sectors helping to drive overall gains in gross farm value despite ongoing challenges.

When the commodities produced by agricultural producers are cleaned, processed, packaged and marketed, these value-added activities generate significant additional economic activity beyond what is captured in the gross farm value. In 2024, the economic impact of these value-added processes was estimated at \$5.55 billion. Combined with the gross farm value of \$7.40 billion, the total economic impact of agriculture, forestry, and fisheries in Louisiana for 2024 was estimated at \$12.95 billion. This represents a 1% increase over 2023, and a 7% increase compared to the previous five-year average. Given this substantial level of economic contribution, it is clear that Louisiana's agriculture, forestry, and fishery sectors remain vital pillars of the state's economy. The continued strength and sustainability of these industries rely heavily on the innovative research, extension education and outreach programs of the LSU AgCenter, which remain central to supporting producers and driving long-term economic growth across the state.

Many Louisiana communities depend on agriculture, forestry, fisheries and wildlife not only for local jobs but for their overall economic well-being. Yet for those who live and work in these industries every day, they represent far more than a business or economic engine, they are a way of life. Across the state, families have lived and worked on farms, forestlands, and in fishing villages for generations, embracing a lifestyle that values hard work, perseverance and tradition, despite the many challenges it can bring, long hours, high risks, and often modest incomes.

Each new production season comes with its own set of uncertainties, from volatile commodity prices and trade dynamics to rising input costs and, most unpredictably, the weather. These challenges underscore the critical importance of the discovery and adoption of innovative agricultural technologies developed by the LSU AgCenter. As agriculture becomes an increasingly sophisticated and integrated part of the global economy, our mission to deliver science-based solutions and educational outreach becomes ever more essential.

At the LSU AgCenter, through the efforts of the Louisiana Cooperative Extension Service and the Louisiana Agricultural Experiment Station, we are proud to support the people and industries that make up Louisiana's diverse agricultural landscape. Our faculty of extension agents, specialists, and research scientists remain dedicated to delivering timely, accurate and practical information to producers and consumers alike. We are honored to be a part of Louisiana's agricultural community and remain committed to serving the industry and the citizens of our state, now and in the years to come.

Louisiana Summary

Agricultural and Natural Resources

2024

The statistical information in this summary was compiled from estimates made by extension agents of the LSU AgCenter after consulting with agricultural agency representatives, agricultural and agribusiness leaders, and others and after study of various reports and resource materials. State specialists with the LSU AgCenter checked parish-level data for specific commodities to ensure accuracy and consistency of all production information. Final review of data was conducted by LSU AgCenter agricultural economist and project director Kurt Guidry in consultation with external sources, including state and federal statistical agencies. Any inquiries about the data in this publication should be directed to Kurt Guidry in the LSU AgCenter's Department of Agricultural Economics who oversees the process of gathering all information for the Louisiana Summary.

Although this material is reasonably accurate and can be used for planning and other general informational purposes, this is not the official document of agricultural data for the state. Official statistical data are gathered, summarized and published by the U.S. Department of Agriculture's National Agricultural Statistics Service, Delta Regional Field Office, 10800 Financial Centre Parkway, Suite 110, Little Rock, Arkansas, 72211. Reproduction or publication of information in this summary should acknowledge the Louisiana Summary as the source but indicate the unofficial nature of the statistics.

Gross farm value was calculated for each commodity, which in some cases included a value from natural resources and consequently may not represent income to farmers. Gross farm values were calculated using calendar-year, market-weighted, state-level average prices, when available. When state-level price information was unavailable, price information was used from adjacent states (Texas, Arkansas or Mississippi) or the nation. Primary sources for prices were USDA National Agricultural Statistics Service, USDA Agricultural Marketing Service, and USDA Economic Research Service. The gross farm value is an indicator of the commodity's contribution to economic activity in the state but is not an indicator of farm profits. Production costs greatly affect profit (or loss) for all commodities. Even when gross income increases over previous years, corresponding increases in production costs may decrease farm profits.

In the state summaries, the value added in cleaning, processing, packaging, marketing, and transporting commodities is an estimate of the total contribution of agriculture and natural resources to the state's economy. The state summary may not be an exact summation of all parish reports as adjustments may occur due to changes in average prices received or to accommodate information from other sources. In each parish table only commodities that were of commercial economic value in that parish this year were listed. In some instances, the number of producers or the number of acres in a parish were not available. An asterisk was used to avoid releasing confidential information when too few producers were present for that commodity. Within some commodity groups, such as grains, fruits and commercial vegetables, the total number of producers has been omitted because some producers grow several different crops within the group. Adding together the producers of individual crops would not give a true total for the group.

New for 2024

For the first time, estimates for rice have been developed separately for the main crop and the ratoon crop (second crop). Given the growing reliance on the ratoon crop by rice producers in the central and southern portion of the rice growing region, the decision was made to specifically identify the number of acres harvested and the yields associated with the ratoon crop. It should be noted that main crop and ratoon crop production are combined to provide an overall rice production and value estimate. The overall rice production and value estimate would be the comparable values to rice estimates in previous versions of this publication.

Animal Enterprises

Gross farm income for all animal enterprises was nearly \$2.1 billion for 2024, up 12.5% from \$1.85 billion in 2023. Value-added was nearly \$1.06 billion for 2024, up from \$933.5 million in 2023. Total value of all animal enterprises in the Louisiana economy was \$3.14 billion, up 12.8% from \$2.79 billion in 2023.

Beef Cattle

Louisiana's beef cattle inventory continued to decrease in 2024, although at a more moderate rate compared to 2023. Record high cattle prices have resulted in increased culling and decreased replacement female retention throughout the country. This is reflected in lowered cow inventories and a reduction in number of beef cattle producers. Beef cow inventory numbers in Louisiana for 2024 totaled an estimated 498,496 head, compared with 527,078 in 2023. The number of beef cattle producers remained somewhat stable, only decreasing from 10,950 in 2023 to 10,610 in 2024. For additional reference, Louisiana had 11,472 beef cattle producers in 2022 prior to the extreme drought and heat experienced in 2023.

Louisiana remains primarily a cow-calf state, with the majority of the 496,885 head of beef cattle marketed weighing less than 700 pounds. Despite a lower inventory, increased market prices resulted in gross farm value increases across all classes of beef cattle. The gross farm value of 194,505 steer calves sold in 2024 was an estimated \$261.1 million, a decrease of approximately 5,048 head but an increase of \$47.7 million from the \$213.4 million reported in 2023. The estimated gross farm value of 166,653 heifers sold in 2024 was an estimated \$194.4 million, a decrease of approximately 4,111 head but an increase of \$37.2 million from the \$157.2 million reported in 2023.

For 2024, 48,699 yearling cattle weighing 600 to 800 pounds per head sold for an estimated \$75.3 million. This was a decrease of only 454 head but an increase of \$12.9 million from the previous year. The number of cow-calf pairs and cull cows marketed decreased overall due to the large herd reduction seen in the previous year. In 2024, 32,055 pairs sold for a gross value of \$65.7 million. This is a decrease of 10,382 head but an increase of \$10.0 million from the previous year. Like the cow-calf pairs, moderate decreases were seen in the number of cull cows marketed. For 2024, 49,627 head of cull cows sold, for a gross value of \$77.0 million. That is a decrease of 12,368 head, but a gross value increase of \$5.1 million compared to 2023. Cull bulls showed only slight changes in 2024 compared to 2023. In 2024, a total of 5,346 head of cull bulls sold for a gross value of \$9.1 million compared to 6,655 head selling for \$8.4 million in 2023.

All classes of beef cattle marketed had a total gross farm value of \$682.5 million in 2024. This was an increase of \$113.5 million compared to 2023.

Dairy

Milk production was reported by eight parishes in 2024. Three parishes in the southeastern part of the state accounted for over 88% of the herds, 90% of the cows and over 90% of the milk produced. The number of dairy farms decreased from 60 in 2023 to 52 in 2024. The number of milking cows decreased from 7,003 head in 2023 to 6,811 head in 2024. Total milk production decreased from 101.2 million pounds in 2023 to 91.2 million pounds in 2024. A reduction of over 10.0 million pounds of milk but a 10.91% increase in the price of milk resulted in only a slight decrease of \$14,660 in the gross farm value of milk.

The value of cull cows, bred heifers, mature cows, breeding age bulls and calves was roughly \$3.77 million. The total value of milk and animal sales to Louisiana dairy producers was \$25.9 million. Value added contributed over \$41.6 million more. The total economic contribution from dairying in Louisiana, including milk sales, animal sales and additional processing was about \$67.5 million, a slight decrease of roughly \$245,000 compared to the previous year.

Another component of the state's dairy industry has been the production of goat's milk. While small compared to the dairy cattle industry, dairy goat production has continued to be a viable industry in the state. In 2024 dairy goats were raised

by 143 producers. A total of 1,541 does were reported to have been milked during 2024 producing about 1.2 million pounds of goat milk. Many of these producers use goat milk to make soap, cheeses, lotion, cheesecakes and pies. These products vary in price depending on the producer and the geographical location where they market their products. The gross farm income of the dairy goat industry was estimated at \$0.71 million in 2024, up from the \$0.41 million generated in 2023.

The total economic impact of the dairy industry for both cattle and goats in 2024 was over \$69 million.

Horses

The horse industry continues to be a significant component of the agricultural economy in Louisiana. The horse industry has traditionally been categorized into three sectors: racing, show or competition, and recreational. In terms of number of horse owners, the breakdown of the industry in 2024 into these three sectors was 11% racing, 14% show or competition, and 75% recreational. In 2024, the breakdown of the horse industry by percentage of total gross farm value generated by each sector was 29% racing, 42% show or competition, and 29% recreational.

The state's racehorse industry in 2024 involved 2,407 breeders who owned 6,079 mares that produced 5,012 foals that sold for \$30 million. Breeders also owned 753 stallions that were bred to 6,080 mares, generating income from stud fees of \$15.2 million. The total gross farm value generated from racehorse production was \$45.2 million. An additional 2,054 racehorse owners had 8,930 racehorses in training or on the track in Louisiana, with a gross farm value of \$89.3 million. The gross farm value of the entire race sector (owners' and breeders' activities) of the horse industry in 2024 was \$134.6 million, not including receipts or fees from racing events or gaming.

The show and competition horse industry (horse shows, barrel racing, cutting, roping, team penning and others) includes 1,815 breeders who own 5,639 mares that produced 5,184 foals that sold for \$20.7 million during 2024. These breeders owned 635 stallions that bred with 4,231 mares, generating \$6.3 million in income from stud fees. The total income generated from show and competition horse production was \$27 million. Another 3,868 owners competed on their 16,685 horses, which had a gross farm value of \$166.8 million. The total gross farm value of the show and competition sector of the horse industry was \$194 million in 2024, not including the income generated from showing and associated activities.

A large portion of the horse industry, both in terms of owners and horses, is recreational. Horses have been used for comfort, exercise and enjoyment for quite some time. Approximately 9,941 recreational horse owners in Louisiana bred 22,722 mares and sold 17,298 foals during 2024 for \$19 million. These horse enthusiasts owned 2,201 stallions that were bred to 5,244 mares, generating income from stud fees of \$2.6 million. The total income from production in the recreational horse industry was \$21.6 million during 2023. Another 20,716 recreational horse owners have 46,875 horses valued at \$117 million – making the total economic contribution of the recreational horse industry \$138.8 million in 2024.

There were a total of 110,519 horses in Louisiana, owned by 40,856 people, with a gross farm value of \$467.3 million in 2024. Value-added activities contributed an additional \$51.4 million in 2024, so that combining farm-gate value and the value-added, the total value of horse sector was \$518.7 million in 2024.

In addition to the estimates of gross farm value and value-added activities, there are other potential impacts of the horse industry to the state's economy. First, the average horse owner has been reported to spend about \$4,000 to \$6,000 annually on items such as feed, tack, equipment, veterinary supplies and medicines. Second, the four racetracks in the state employ a large number of people and have been reported to generate expenditures of over \$1 billion annually. Finally, the show and competition industry conducts numerous events and activities each year and is estimated to generate \$200 million annually in expenditures. The American Horse Council suggests that the total economic impact of horse production and these related activities like horse racing and competitions is in excess of \$3 billion annually for the state of Louisiana.

Poultry

Broilers and Eggs

Poultry production continues to be the largest animal agricultural industry in Louisiana and is second only to forestry in total economic value for all agricultural commodities. In 2024, 695 Louisiana growers (small producers and commercial operations) produced nearly 1.04 billion pounds of broiler meat with a gross farm value of \$773.8 million. Broiler production was up over 6% in 2024 from the 977.9 million pounds estimated for 2023. With larger production and slightly higher prices, the gross farm value increased to \$773.8 million in 2024 from the \$713.9 million in 2023. Commercial broilers are produced in 11 parishes: Bienville, Claiborne, Jackson, Lincoln, Natchitoches, Ouachita, Sabine, Union, Vernon, Webster and Winn.

While broiler production is far and away the largest component of the poultry industry in the state, there are several other components that positively contribute to the state's economy. A total of 171 breeder flock producers in 2024 produced 14.9 million dozen hatching eggs with a gross farm value of \$48.4 million. A total of 87 pullet producers produced over 1.2 million pullets with a gross farm value of \$26.8 million. Finally, a total of 1,213 egg producers (small producers and commercial operations) had a total table egg production value of over 20 million dozen eggs valued at \$50.7 million.

When all the facets of the poultry industry are combined, the total gross farm value was estimated at nearly \$900 million in 2024, up roughly 14% from the \$787.8 million in 2023. Increases in broiler coupled with slightly higher broiler prices along with sharp increases in the prices for edible eggs, breeder eggs and pullets all helped push gross farm value higher in 2024. Value-added activities associated with poultry production added an additional \$877.4 million in economic activity in the state, bringing the total economic impact of the poultry industry to \$1.78 billion in 2024.

Quail

Quail production in the state generally consists of smaller operations reaching niche markets. In 2024, a total of 21,370 quail were estimated to be produced and sold by 48 producers resulting in a gross farm value of \$138,905. Value-added activities associated with quail production provided an additional \$15,280, bringing the total economic contribution of the quail industry to \$154,185 in 2024.

Rabbits

The production of rabbits for meat and exhibition involved 457 Louisiana producers during 2024. The rabbit industry produced a total estimated 48,440 pounds for sale in 2024, generating a total of \$241,614 in gross farm income. Of those totals, 28,299 pounds of production were from fryers and the remaining 20,141 pounds were from does. When the value-added activities of \$25,369 are combined with farm level income, the total economic impact of the industry in 2024 is estimated at \$266,983. This was an increase of roughly \$23,000 from 2023.

Sheep and Goats

An increase in sheep production continued through 2024. Sheep, lambs and wool were produced by 557 producers in 41 Louisiana parishes, compared to 465 in 2023. Similarly, ewe inventory totaled 7,163 head in 2024, an increase of 2,362 head compared to 2023. This increase continues to reflect the number of producers interested in beginning to raise hair sheep. The total number of lambs that were marketed (slaughter, feeder, and club/show lambs) was estimated to be 5,266 in 2024, up from 4,131 marketed in 2023. Producers also marketed 2,421 stocker and 956 cull sheep in 2024. This is an increase of 895 head of stocker and 182 cull sheep compared to 2023. Wool production totaled 8,816 pounds, which was down from 9,022 pounds in 2023. The total gross farm value of the sheep industry increased to \$1.7 million in 2024 which is a 30% increase from 2023.

The Louisiana meat and dairy goat industry during 2024 consisted of an estimated 1,273 producers across 56 parishes, up slightly from 1,126 producers in 2023. Approximately 1,541 dairy goats produced 1,182,724 pounds of milk in 2024, an increase of 776 head and 495,477 pounds of milk compared to 2023. The gross value of milk produced was an estimated \$709,634. Total inventory of breeding-aged meat does was estimated at 11,588 does in 2024, which is stable from 2023. Goat producers marketed a total of 6,350 slaughter goats valued at \$1.3 million in 2024, compared to the 7,505 head at a value of \$764,350 in 2023. Stocker goats sold in 2024 numbered 4,187 with a value of \$696,800. This is a decrease of approximately 85 head and \$506,800 from 2023. There were 1,625 cull goats marketed in 2024 at a value of \$273,130. Goats sold as club or show goats numbered 1,732 head, valued at \$692,800, an increase of 189 head and \$75,600 compared to 2023. The gross farm value of meat goats sold in Louisiana during 2024 was \$3.03 million, down roughly \$316,000 from \$3.46 million in 2023.

Swine

The Louisiana swine industry is primarily comprised of relatively small producers. In 2024, a total of 382 producers were estimated to have a total inventory of 2,503 sows with an average sow inventory per producer of between six and seven sows. Other than servicing a local or niche market, most of the swine production in the state is targeted to the show/club pig market. In 2024 a total of 1,885 show pigs were estimated to be sold with a gross farm value of \$754,000, representing roughly 45% of the total gross farm value generated by the swine industry. Sales of feeder pigs, slaughter hogs, and culls represent the remaining 55% of the total gross farm value generated by the industry. In 2024, 4,931 feeder pigs were sold for an estimated value of \$193,078. Sales of 2,881 slaughter hogs generated a gross farm value of \$599,098 while the sale of 847 cull animals (sows and boars) generated a gross farm value of \$124,102.

When added together, the gross farm value of all classes of swine is estimated at \$1.67 million for 2024, up from \$1.58 million in 2023. Value-added activities associated with the swine industry are estimated at \$208,785, bringing the total economic impact of the industry to the state economy to \$1.88 million, up from \$1.78 million during the previous year.

Exotic Animals

Exotic animal enterprises are a relatively small component of the total agricultural industry. The number of producers statewide was estimated at 58 in 2024, up from 50 in 2023. The total number of animals marketed increased slightly from 1,625 in 2023 to 1,756 in 2024. Due to increased marketings, the total gross farm value in 2024 was \$875,300, up from the previous year's gross farm value which was projected at \$811,400. When value-added activities are added to gross farm value, the total economic impact was estimated at \$967,207, up marginally from \$896,597 in 2023.

Fisheries and Wildlife Enterprises

Total farm value of all fisheries and wildlife enterprises during 2024 was \$818.6 million, down roughly 7% from the \$886.3 million in 2023. Value-added in 2024 was \$564.5 million, down from \$632.7 million in the previous year. Total value of all fisheries and wildlife enterprises to the Louisiana economy for 2024 was \$1.38 billion, down roughly 9% from the \$1.52 billion in 2023.

Aquaculture

Louisiana has long been recognized for supporting one of the most diverse aquaculture industries in the United States. Species and products such as crawfish, catfish, alligators, oysters, tilapia, baitfish, soft-shelled crawfish and crabs, ornamental fish, baby turtles, a variety of freshwater game fish and other minor species all have been commercialized successfully. Louisiana's producers continue to be among the leaders in the nation in crawfish, oyster, pet turtle and alligator sales.

Farm-raised crawfish continued to be the state's most valuable aquaculture sector in 2024. Growth in demand, both within the state and regionally, has continued to foster expansion of acreage and production, and crawfish aquaculture has increasingly been incorporated in other farming operations in recent years as producers look to offset adverse conditions in rice markets. In 2024, however, some industry observers saw demand outpaced supply. Estimates from the field in 2024 indicated farm-raised crawfish production occupied over 367 thousand acres, up 2.38% from the previous year. Total harvests, however, were 128 million pounds, a significant decrease of 35.68%, and gross farm value was \$258.7 million in 2024, which was near the \$256.8 million value of the previous year. The 2023/2024 crawfish season had significantly lower production due to the effects of the severe drought and extreme weather conditions experienced during the summer, fall and early winter of 2023.

A total of 267,067 farmed alligators were harvested in 2024, down significantly from the prior year's harvest of 314,544. Although they have historically been Louisiana's second most valuable aquaculture commodity, farm-raised alligators occupied the third-place spot for the second year running in 2024, with an estimated gross farm value of \$56 million. This reflected a continuing trend of slowing market demand, as supply and demand imbalances in domestic and world markets, foreign competition and climate impacts on hatchling availability combined to reduce output.

Oyster production information reported in this summary represents a one-year lag. Information on Louisiana oyster harvests and sales is compiled by the Louisiana Department of Wildlife and Fisheries and provided to the National Marine Fisheries Service, but the final compilation of the data is not available until the middle of the following year. Oyster sales in 2023 fell to 958,863 sacks valued at \$63.8 million, reflecting reductions of 14.3% and 16.6%, respectively, from the previous year.

Recent increases in farmed catfish production and revenue continued in 2024, with 16 million pounds of production valued at \$17.7 million, increases of 57% and 40.2%, respectively. And while numerous segments of Louisiana's aquaculture industry continue to provide positive economic impacts to the state, they are significantly smaller than those of crawfish, alligator, oyster and catfish production. Pet turtle hatchling production of red-ear sliders continued to decline in 2024, but sales of more valuable species to foreign collectors and enthusiasts helped bolster total farm gate value. Many licensed turtle operations continue to be inactive. Fish bait and minnow production continue to evolve to meet the demands of recreational fishers, with out-of-state competition and mergers and acquisitions throughout the industry imposing significant constraints on profitability. Other aquaculture species include game fish fingerlings, ornamental fish, soft-shell crabs and crawfish, and other minor species. Each of these commodities has a very limited number of producers.

Examining the economic impact across all commercial enterprises indicates that the total gross farm value of Louisiana aquaculture in 2024 was approximately \$399 million, which was 5.2% lower than the previous year's total. Value-added multipliers associated with aquaculture value chains (processing, boiling, shucking, packaging, restaurants and retail sales)

contributed an additional \$269 million to the state's economy, bringing the total impact of Louisiana's commercial aquaculture to \$668 million in 2024. Additionally, approximately 140,000 private ponds are found throughout Louisiana, totaling some 46,000 acres. Although these private ponds are not included in the 2024 state total for aquaculture, they do have positive economic impacts for recreation and enhancement of property values. These impacts have been estimated to exceed \$70 million for 2024.

Fisheries

The harvest of freshwater and marine finfish and shellfish in Louisiana largely contributes to the state's agricultural economy. Fishery landings are recorded by two government agencies, both state and federal. The Louisiana Department of Wildlife and Fisheries receives monthly reports from the initial buyers (processors, dealers, etc.) who are required to record every transaction via trip tickets. Species weights and dockside sales values of the landings are reported for all commercially harvested species. The National Marine Fisheries Service is also responsible for estimating fisheries landings, using both regional National Marine Fisheries Service data collectors and Louisiana Department of Wildlife and Fisheries reports. The information reported here is from those two cooperating sources. All this data is provisional and subject to change.

The freshwater and marine fisheries data presented in the report this year (2023) reflect the calendar year 2022. The one-year lag is necessary to ensure data accuracy. Real-time reports on fisheries landings are not available until four months after the fact, and final data often runs six to twelve months behind. Estimating landings for the second half of the year based on landings reports from the first half is inaccurate. This method of reporting fisheries landings data has been in place since the 2004 Louisiana Summary; data prior to that volume may not be directly comparable to the data reported since 2004 because of using the different estimation methods. To compare state-level landings for years prior to 2004, on a calendar-year basis, please consult the US-NOAA-NMFS website. Beginning in 2020, menhaden were included in Parish-level marine finfish fisheries statistics when historically they have been kept separate. The volume of menhaden catch can represent up to 99% of the marine finfish landings category but only 90% of the value. As such, we report the entirety of the landings category; however, in an attempt to contextualize the state-level landings, we have elected to report the proportion of species-level catch US-NOAA-NMFS marine fisheries data although there are minor discrepancies in the landings and landings value.

One final caveat is that parish totals for fisheries landings will not equal the state total because of legal confidentiality requirements. When there are fewer than three sources in a parish that report landings of a fisheries commodity, the number of landings cannot be publicly released by the Louisiana Department of Wildlife and Fisheries without breaking confidentiality requirements. There may also be parishes reported in this volume for which no landings or values were provided by either of those agencies but for which there was catch. Furthermore, fisheries landings are reported for the parish in which the fish are offloaded – not the parish in which the boat and its crew may be domiciled or the parish where the catches were made. However, producer estimates are based on commercial licenses which are based on the fishermen's domicile.

2021 Impacts

In 2023, overall wild caught shrimp landing prices began to decline to their lowest point in 15 years across all size classes and species of shrimp in the northern Gulf region. This was especially pronounced in Louisiana with landing prices reported across the state at less than 1\$ per pound at the shrimps largest size grade which decreased further as the shrimp got smaller. This drop in price is presumed to be the high volume of imported shrimp in United States markets. Of the shrimp consumed in the U.S. approximately 8% to 10% is wild caught in the U.S., with many of the imports being supplied by through aquaculture. It is plausible that there have been spillover affects into other fisheries, additional labor, increased fishing effort, etc. but it has not been measured.

2023 was also a year of exceptional drought for most of the state. As of Oct 6, 2023, according to the University of Nebraska's drought monitor, almost 85% of Louisiana was in "extreme drought" while 58% of our state is in "exceptional drought." To add some perspective to this statement exceptional drought (D5 on a D0 – D5 scale) is the highest category of drought and historically has resulted in compromised fishing, loss of pastures, loss of crops and water shortages. Compounding the strain resulting from the drought, the summer of 2023 in southern Louisiana experienced extreme heat not

observed in the previous 100 years. In the summer of 2023, Baton Rouge had 32 days at or exceeding 100 F, while the next closest case of extreme heat of this magnitude was in 1921 with 21 days at or exceeding 100 F (temperature measured at the Baton Rouge Regional Airport and Southeast Baton Rouge Monitoring Stations). Drought can result in higher-than-average salinities, low-water levels, and hypoxia, all of which can alter fisheries landings and often have multi-year affects.

Across all major Louisiana fisheries landings in 2023, the volume of landings were lower in 2023 than in 2022, aside from the wild crawfish fishery, which was up by one-third.

Freshwater Fisheries

The freshwater finfish (in order of weight landed) are blue catfish, buffalo, non-shad herrings, gizzard shad, and channel catfish. On a whole, freshwater finfish hold a lower commercial value than marine finfish. Total freshwater finfish value has decreased (about 10%) from 2022 to 2023. Landing values in 2022 were \$6.0 million for 13.3 million pounds whereas landing values in 2023 were \$5.4 million for 12.0 million pounds. Landings marginally decreased in 2023 by 670 thousand pounds and the price per pound (\$0.45) was identical to 2022. The total number of freshwater finfish producers decreased by 576 in 2023 from 2,062 to 1,486. In most cases, freshwater fish are less valuable than marine fish (excluding menhaden), and on a whole the freshwater finfish fishery (\$5.4 million in 2023 landings) is 5% of the marine finfish fishery (\$126 million in 2023 landings).

Most of the parishes with wild crawfish landings are within the Atchafalaya Basin, aside from St. Tammany, where inflows from both the Mississippi and Red Rivers are controlled by the U.S Army Corp of Engineers. Wild crawfish compete with the farm raised crawfish in the markets and wild volumes are largely constrained by the floodwater events in the Atchafalaya basin. The difference is minimal; however, wild crawfish tend to be bigger in size and have a slightly different flavor due to their diet. In 2023, wild crawfish landings were up 34% from 2022 at 11.1 million pounds compared to 8.3 million pounds. Value was only 5% higher in 2023 at \$15.0 million. This drop in value was due to the crawfish average price per pound being \$1.35 in 2023 compared to \$1.72 in 2022. The number of wild caught crawfish producers in 2023 was 1,140.

Landings from the freshwater fisheries sector were almost identical at \$20.4 million in 2023 compared to \$20.3 million in 2022.

Marine Fisheries

Marine finfish landings for food are varied and complex, with 54 different species being landed for a total of 738 million pounds in 2023. This was a 3.3% decrease from 2022, when 763 million pounds of marine finfish were landed in Louisiana. The value of marine finfish landings in Louisiana in 2023 was \$127 million, which was almost the same as 2022 when landings were valued at \$122 million. With the exclusion of menhaden, the top five landed species were black drum, red snapper, blacktip shark, striped mullet, sheepshead and king mackerel. By value, (also, excluding menhaden), the top five species were red snapper, black drum, king mackerel, sheepshead and vermillion snapper. The aggregate price per pound for marine fish was \$0.17 which largely represents the price per pound for menhaden. This price was almost identical from 2022 where the aggregate price per pound was \$0.16. The low price per pound reflects the value of menhaden as a non-food fish. While this fish is too small and oily to eat, it is used in a variety of different ways including fertilizers, animal feeds, omega-3 dietary supplements, cosmetics, as well as bait. The prices of these products are a function of the world supply of oils and meals.

In 2023, 6.2 million pounds of oysters were harvested by 438 fishermen, or about 960 thousand sacks. This is a 13.2% decrease in landings from 2022, where 7.2 million pounds were landed. In 2023, the price per pound for oysters was similar at \$10.29 (\$66.58 per sack), a compared to \$10.57 in 2022 (\$68.36 per sack). To calculate prices per sack, an assumption of 6.47 pounds of shucked oyster meat per sack was used. The gross value of oysters harvested in 2023 was \$63.8 million, a decrease of 16.5 percent from \$76.5 million in 2022.

Louisiana hard crab landings usually range from 40 to 50 million pounds annually made up of almost 100% blue crab with less than 0.1% of stone crab claws. Blue crab landings were 44.9 million pounds, fished by 1,756 license holders and

valued at \$80.1 million in 2023. This was a 12.4 decrease in landings from 51 million pounds and a 12.4% decrease in value from \$91.4 million in 2022.

Peeler or buster crabs are blue crabs that are close to molting their shell. These crabs are sold to soft shell facilities to produce soft shell crab. For many years now, the soft-shell industry has been in decline. In 2022, 3,322 pounds of soft shell were produced. In 2022, 2,651 pounds were produced valued at \$27,982.

Louisiana shrimp landings in 2023 consisted of 3 species: white shrimp, brown shrimp and Atlantic seabob shrimp. Historically, Louisiana shrimp harvest landings and values have been split between white shrimp and brown shrimp (about 50%) with a small fraction of landings represented by pink shrimp and seabobs (<1%). In 2023, the proportion of white shrimp to brown shrimp landed was skewed to a majority white shrimp (85%) with only 15% of the shrimp landings comprised of brown shrimp. In 2023, the aggregate shrimp landings were 84.5 million pounds valued at \$61 million. This was an decrease in landings from 2022 by 9% from 80.7 million pounds, and an extreme decrease (45.7%) in the value from \$112 million. The price per pound was 37% lower in 2023 (\$0.83 per pound) relative to \$1.39 per pound in 2022.

In 2023, marine fisheries landings in Louisiana were valued at \$332 million, an decrease from \$40 million in 2022.

Fur

As reported by the Louisiana Department of Wildlife and Fisheries, the total value of the 2023–2024 furbearer harvest was estimated at \$143,264, up from the estimated total value of \$85,649 reported in 2022–2023. The total number of trapping licenses sold decreased from 2,989 reported in 2022–2023 to 2,692 reported in 2023–2024. The total number of pelts sold in 2023–2024 was 6,297, up from 5,463 pelts sold in 2022–2023. Over 75% of the pelts sold were harvested from beaver pelts (2,510), raccoon (1,390), and otter (926). The average price paid per pelt in 2023–2024 was \$22.73, up sharply from \$15.68 in 2022–2023. The average price paid per pelt across species ranged from a low of \$0.60 per pelt for opossum to a high of \$57.75 per pelt for bobcat.

The total number of nutria harvested under the Coast-wide Nutria Control Program during the 2023–2024 season was 401,312, which was significantly up from 221,404 harvested in 2022–2023 and was the second largest harvest since the inception of the program. When the \$6,00 per nutria paid as part of the CNCP is combined with the value of nutria pelts sold, the total value of the nutria was estimated at \$2,407,872, up from \$1,328,424 in 2022–2023.

Hunting Lease Enterprises

The value of recreational hunting in Louisiana is estimated by the income derived from hunting lease enterprises. The number of producers who leased land in the state during the 2023–2024 hunting season was estimated at 5,188, up from 4,752 reported during the 2022–2023 hunting season. The 2023–2024 estimate consists of 3,624 individuals who leased their land for upland game hunting (primarily white-tailed deer and wild turkey) and 1,564 individuals who leased their land for waterfowl hunting.

In 2023–2024, approximately 4.3 million acres were leased for upland game hunting and approximately 1.4 million acres were leased for waterfowl hunting. Estimates for acres leased for upland game hunting are up from the previous year when compared to the approximate 3.9 million acres reported lease in 2022–2023. Acres leased primarily for waterfowl hunting were down somewhat when compared to the previous season of 1.4 million acres. In 2022–2023, the estimated value for upland game hunting leases was approximately \$76 million and \$40.1 million for waterfowl, both up from the previous year. The estimated price per acre of leased land for hunting purposes in 2023–2024 was \$17.50 per acre for upland game and \$28.40 per acre for waterfowl.

Honey

In 2024, the total number of hives were estimated at 36,485, up from 31,460 in 2022. This increase is believed to be the start of a rebuilding phase after the impacts caused by the drought and excessive heat in 2023. The increase in hives along with improved weather conditions in 2024 helped to push total honey production to 2.6 million pounds, up from 2.4 million pounds in 2023. Despite the slight increase in production, total farm gate value was down slightly in 2024 at \$6.1 million from the previous year's estimate of \$6.3 million. This was due to a decrease in the estimated price for 2024 falling from \$2.61 per pound in 2023 to \$2.35 per pound.

Plant Enterprises

The gross farm value of all plant enterprises was roughly \$4.5 billion in 2024, a slight decrease of 1.5% from the \$4.57 billion in 2023. Value added was \$3.94 billion for all plant commodities during 2024, essentially unchanged from 2023. Total value of all plant crop enterprises to the Louisiana economy was \$8.44 billion in 2024, down marginally from \$8.51 billion in 2023.

Cotton

In 2024, there were 136,485 FSA certified acres harvested in the state of Louisiana. This was a considerable increase from the 113,687 acres of cotton harvested in 2023. However, it is still lower than the 183,536 acres harvested in 2022. Approximately 63% of the acres in 2024 were irrigated. Although rain events delayed some cotton acreage planting to late May/early June, yields across irrigated and dryland acres averaged 994 pounds of lint per acre which is higher than the 875 and 946 pounds of lint per acre averages in 2023 and 2022, respectively.

Gross farm value of cotton lint was \$104.3 million in 2024. Cotton seed value contributed an additional \$24 million. Gross farm value of all cotton sales was \$128.3 million.

Feed Grains

In 2024, there were 488,339 acres of feed grains harvested in the state, down over 197,000 acres from the 685,872 harvested in 2023. All of the reduction was attributable to reduction in corn acres in 2024. Corn acres fell by nearly 231,000 acres in 2024. Offsetting the large reduction in corn acres was grain sorghum acres that increased by nearly 33,000 acres and oats acres that nearly doubled going from 521 in 2023 to 961 in 2024. Lower prospects for corn prices heading into the 2024 planting season was likely the primary cause for the lower acreage numbers. Most of the reduction in corn acres was planted to soybeans.

While yields improved in 2024 for all feed grains from the drought impacted levels seen in 2023, the large reduction in acres sharply reduced total production of feed grains. Lower production and sharply lower commodity prices essentially cut the total gross farm value for feed grains in half in 2024, falling from \$750.2 million in 2023 to \$385.6 million. Value-added for feed grains was estimated to be \$67.5 million in 2024. When combined with the gross farm value, the total value of feed grain production in Louisiana was estimated to be \$453.1 million in 2024, down from the \$881.5 million level estimated for 2023.

Corn

There were 447,997 acres of corn harvested in 2024, which was a decrease from 678,797 acres of corn harvested in 2023. However, it is on par with the 443,445 acres that were harvested in 2022. Corn yields in 2024 averaged 187.2 pounds per bushel. This was an increase from 176.9 bushels per acre average from 2023. It is likely this increase was due to consistent rainfall during the 2024 season in comparison to the severe drought Louisiana corn growers faced in 2023.

Gross farm value of corn production in 2024 was \$367.4 million which is a stark decrease from the average gross farm value of corn production in 2023 of \$747.1 million. This large reduction can be attributed to lower acreage and production along with sharply lower prices. The average price in 2024 is estimated at \$4.38 per bushel as compared to \$6.22 per bushel in 2023.

Grain Sorghum

In 2024, 39,380 acres of grain sorghum were harvested in the state. This is a huge increase from the 6,554 acres of grain sorghum that were harvested throughout the state in 2023. However, it is more comparable to the 26,780 acres harvested in

2022 and 50,097 acres harvested in 2021. Grain sorghum yields in 2024 averaged 97.2 bushels per acre, which was the highest increase in bushels per acre over the last several years. To compare, the average bushels per acre were 76.9, 78 and 82.4 in 2023, 2022 and 2021, respectively. This increase in yield could possibly be contributed to the consistent rainfall that occurred over the 2024 season.

The gross farm value of grain sorghum production in 2024 was \$18.1 million, which is an increase from the \$3 million gross farm value of grain sorghum production in 2023. The reason for this increase was the increased numbers of acres harvested in 2024 by Louisiana sorghum producers.

Oats

In 2024, eight producers planted 960 acres of oats, compared to three producers and 521 acres in 2023. Harvested acres were 960 and 521 for 2024 and 2023, respectively. Yields in 2024 averaged 46.6 bushels per acre with a total production of 44,771.4 bushels with a value of \$166,102.

Forestry

Louisiana's timber industry in 2024 exhibited significant volatility throughout the year, facing continued headwinds from economic uncertainties while showing signs of resilience in certain sectors. Following the challenging 2023 performance, the industry continued to navigate difficult market conditions characterized by high mortgage rates, housing market slowdown, and seasonal fluctuations.

Pine sawtimber, historically a cornerstone of Louisiana's timber industry, experienced significant volatility throughout the year. After maintaining relative stability early on, prices plummeted in the third quarter to \$22.94 per ton, representing a dramatic 17% quarterly decline. This sharp drop was primarily attributed to seasonal factors, with increased timber supply coinciding with reduced demand from softwood lumber mills facing their own market challenges. The year concluded with some recovery, as pine sawtimber prices reached \$25.46 per ton in the fourth quarter, though still ending the year down 4.1% compared to 2023's average of \$26.84 per ton. Oak sawtimber prices also saw a modest decline, averaging around \$44.26 per ton, compared to \$45.25 per ton in 2023. In contrast, mixed hardwood sawtimber experienced an increase, averaging approximately \$34.52 per ton, up from \$31.56 per ton in 2023, with a strong performance noted in the latter part of the year. Prices for pine chip-n-saw decreased slightly to an average of \$17.49 per ton from \$18.05 per ton in 2023, indicating some softening in demand. The pulpwood sectors faced particularly severe pressure in 2024. Pine pulpwood prices dropped significantly, falling to an annual average of \$5.76 per ton, down 16.5% from 2023's \$6.90 per ton. Hardwood pulpwood followed a similar trajectory, declining 13.4% to \$7.46 per ton from 2023's \$8.61 per ton. Both categories experienced their lowest points during the second quarter, with pine pulpwood reaching just \$5.05 per ton before showing some recovery in the fourth quarter.

Throughout the year, Louisiana's timber industry operated within a broader regional context influenced by developments across the South. The delayed implementation of the European Union Deforestation Regulation and ongoing discussions about potential increases in U.S. tariffs on Canadian lumber imports created additional market uncertainty. However, these policy discussions also presented potential opportunities for domestic lumber producers, with increased tariffs potentially benefiting Louisiana's sawtimber producers through enhanced domestic demand. Looking toward 2025, Louisiana's timber industry appeared positioned for cautious optimism. The fourth-quarter recovery patterns suggested improving market dynamics, while the potential for increased Canadian lumber tariffs could create new opportunities for domestic producers.

Fruit Crops

Following a challenging 2023 season marked by late freezes and prolonged drought, 2024 brought more favorable conditions for fruit producers across Louisiana. The absence of unusual late freezes and a cooler-than-average spring allowed for more consistent flowering and fruit set, particularly benefiting early-season crops.

Mayhaw and blueberry crops were on track throughout the season, with mayhaw yields reported as good to heavy—an improvement over the freeze-damaged 2023 crop. Mayhaw acreage increased from 246.3 acres in 2023 to 338.4 acres in 2024, with a gross farm value of \$2.36 million, slightly down from \$2.7 million the previous year. Blueberries also saw a strong rebound, with acreage expanding from 351.3 acres to 423.9 acres, and gross farm value rising from \$7.3 million to \$8.67 million.

Strawberry production remained concentrated in Tangipahoa and Livingston parishes. While cooler spring temperatures slightly delayed early harvests, the lack of severe freeze events helped maintain crop quality. Strawberries continue to be a challenging crop in Louisiana due to consistently high disease pressure, which is exacerbated by the state’s humid climate. Growers must remain vigilant with disease management, especially when using row covers, which can contribute to increased pathogen spread. Despite a slight decrease in acreage from 198.0 acres in 2023 to 193.0 acres in 2024, gross farm value increased from \$11.6 million to \$12.18 million, indicating strong market demand and pricing.

Citrus production, primarily located in the southern part of the state, benefited from the absence of hurricanes and hard freezes in 2024. This was a welcome change from 2023, when some southern growers experienced damage from late-season cold events. Satsumas remain the dominant citrus crop, followed by navels and other assorted citrus varieties. Citrus greening and canker continue to pose serious threats to the industry statewide and require ongoing monitoring and management. Meanwhile, repeated cold injury in recent years has led to tree loss in some areas, especially in the northern range of citrus production. Citrus acreage declined significantly from 403.5 acres in 2023 to 227.5 acres in 2024, and gross farm value dropped from \$4.9 million to \$3.32 million.

Blackberry production is gaining momentum in Louisiana, particularly in Central and Northern regions. Emerging interest from new and existing producers is driving increased plantings, supported by strong market demand and the crop’s potential for diversification and agrotourism. Acreage increased slightly from 98.5 acres in 2023 to 100.7 acres in 2024, while gross farm value rose from \$3.7 million to \$4.43 million, reflecting both improved yields and strong retail pricing.

In total, commercial fruit crops were harvested on approximately 1,545.6 acres in 2024, a slight decrease from 1,595 acres in 2023. The gross farm value for fruit crops reached \$33.05 million, up from \$32.9 million in 2023. Strawberries, blueberries, and citrus remained the top revenue-generating fruit crops in the state.

Commercial Greenhouse Vegetables

Greenhouse production of vegetable crops provides Louisiana growers with nearly year-round environmental control, optimizing vegetable production. While growers can regulate air temperature, soil texture or soilless media, and precise fertilizer rates through water systems, they remain susceptible to insect and disease pressures. Additionally, nutrient deficiencies tend to manifest early in artificial soils. The use of artificial mediums also presents challenges for growers seeking time off, as soil moisture is critical in soilless media and hydroponic systems. A single hour without water in a hydroponic system can result in yield loss, while a day can cause crop death. Consequently, greenhouse growers require labor seven days a week to manage their crops.

While greenhouse production of vegetable crops such as tomatoes, cucumbers, and lettuce can occur year-round, growers must adjust various aspects of production to maintain optimal yields. For instance, during the fall and winter months, heaters must be operated for tomato production, though off-gasses from certain heaters can cause deformities in fruit and foliage. Reduced natural sunlight may necessitate the use of supplemental lighting. The summer months of July and August pose challenges for lettuce production in greenhouses, requiring cooling systems and higher seeding rates per cell to accommodate foliage volume before bolting. Consequently, it is common for greenhouse growers to take breaks in tomato production during the coldest, darkest months and in lettuce production during the hottest months, although some growers operate year-round.

The growth rates of lettuce, tomatoes, and cucumbers per square foot in greenhouse environments are notable. With proper maintenance and the willingness to manage additional production costs, the yield per unit area can significantly

surpass that of field vegetable production. For those deterred by the high costs of greenhouse construction, high tunnels offer a viable alternative. High tunnels are simplified greenhouses where crops are planted directly in the ground rather than in bagged culture or hydroponic systems. High tunnels extend the growing season, allowing producers to initiate warm-season crops two to three months earlier and extend their cultivation into the winter months due to the additional degrees of protection they provide against adverse winter conditions.

There is considerable potential for the expansion of controlled environment agriculture in Louisiana. A significant portion of out-of-season vegetables are imported into the United States annually. The LSU AgCenter advocates increased local greenhouse and high tunnel production to enhance the availability of fresh produce during the off-season. The primary crops cultivated in Louisiana greenhouses include tomatoes, cucumbers, and lettuce. The projected gross farm values for 2024 are \$1.3 million for tomatoes, \$134,600 for cucumbers, and \$281,480 for other crops, predominantly lettuce.

Hay Sold

Hay production for commercial sales is a limited part of the total hay production in Louisiana. Nevertheless, hay produced from 264 acres of alfalfa and 437,250 acres of grasslands was sold by 3,200 producers in 2024. Yields averaged 3.4 tons per acre from the grasslands harvested for sale and 5.3 tons per acre from the alfalfa harvested for sale. Production included 1,610,484 tons of grass hay and 1,392 tons of alfalfa hay. Compared to numbers reported in 2023, the acreage of grasslands used for commercial hay production increased by 19%.

Weather conditions were conducive for optimum hay production during much of the growing season in 2024. However, some regions in north Louisiana did have dry conditions during the summer months. Overall, grass hay yields were two times higher in 2024 as compared to 2023. Gross farm value of all hay sales, including some minor alfalfa production, was \$259.8 million, which was an increase of 16% from the previous year. This increase in gross farm value for hay production was likely due to the better growing conditions, which caused hay production to be much higher in 2024 as compared to 2023.

Home Vegetable Gardens

In typical years the number of home gardens fluctuates greatly with people's interest and the economy. When economic conditions are weak there tends to be additional interest in producing their own food in the face of rising food costs. Also, with the conditions created by the COVID-19 pandemic in 2020 and 2021, there was a renewed interest in home gardens. The National Gardening Association found that 19 million new gardeners were gained during the COVID-19 pandemic.

Vegetable gardening not only provides food but is also reported to reduce stress and provide a mental break from the day. Research conducted by the U.S. Department of Agriculture indicated approximately one in three households have some kind of garden, including backyard fruit trees, vegetable plots, berry patches, etc.

With this assumption of a garden for one in every three households, a methodology based on parish population data was developed to estimate the number of gardens in each parish of the state. Louisiana population in 2024 was estimated at 4.60 million people. Assuming 2.6 people in every household, the total number of households in the state is approximately 1.77 million. Further, assuming roughly 35% of the households have home gardens, translates in a total of roughly 619,000 home gardens in the state. Based on the USDA study, the average value of a home garden was roughly \$525 in 2008. Using annual price changes of a mix of vegetables and fruits that would be believed to be grown in the typical Louisiana home garden, that estimated value from 2008 is adjusted annually to estimate a current value of home gardens. For 2024, the estimated value of a home garden was calculated at \$636. Given these assumptions, the estimated gross farm value of home vegetable gardens was estimated at \$393.6 million.

Nursery Crops

Louisiana's nursery industry produces woody ornamental plants (i.e. trees and shrubs), herbaceous perennials, annual plants, and floriculture crops, as well as some edible stock (i.e. fruit and nut trees). Inventory challenges were cited as one of the most common issues in 2024, despite ample demand from consumers being reported. The robust sales of the 2023 season dwindled the availability of several popular landscape species for the 2024 season; however, weather impacts of 2023 and early 2024 exacerbated inventory issues. Nursery growers expressed a range of reports regarding expansion or contraction of sales, with some reporting modest declines in sales (>5% decline), no differences in sales between the two years, or continued stable growth in sales. Factoring the various reports, it is estimated that nursery sales overall were slightly down (3% reduction from 2023 sales); however, several factors are likely causal agents.

The prolonged drought and record heat of summer 2023 resulted in immense stress to existing and newly planted landscape plants, yielding substantial losses of ornamental plants in the landscape. This presented an opportunity for replacement plant sales, spurring demand in many cases. The effects of the prolonged drought in 2023 similarly posed a challenge to nursery growers, with lingering effects bleeding well into 2024 and beyond. While growers were able to combat the drought (to an extent) through increased irrigation, the sustained sun exposure and record heat indices presented a challenge in its own right. Nursery growers reported foliage discoloration, leaf scorch, defoliation, and mortality of several popular ornamental species throughout 2023. These effects had severe impacts on nursery stock in 2024, both in terms of plant availability (due to mortality) and plant size. Plants under stress in 2023 exhibited reduced growth versus typical years, thus interrupting up-potting practices for multi-year woody ornamentals. In other words, plants grown in smaller containers often failed to reach typical sizes for replanting into larger container sizes, affecting the internal supply chain for some growers. Beyond the effects of the 2023 drought and heat, January of 2024 brought a severe freeze that impacted operations and inventory before the start of the spring season, as well as caused damage to plants in the landscape. In summation, atypical environmental conditions (at both ends of the spectrum) created inventory issues for nursery growers.

Overall, nursery sales in 2024 were quite variable, where some nursery growers observed an increase in sales relative to 2023, while others observed a decrease. It is important to note that 2023 sales were largely considered to be a great year, and a modest decrease in 2024 sales may be partially attributed to a regression to the mean. Several factors beyond weather impacts may have influenced sales in 2024. The impacts of inflation on nursery growers (i.e. cost of production materials such as fertilizer, plastics, etc.) and consumers (less disposable income) likely influenced purchasing decisions and profitability. This may have been exacerbated with the typical tightening of discretionary funds for plants that is commonly reported during election years. Despite the challenges presented, many Louisiana nursery growers have worked towards identifying pathways to avoid similar situations (i.e. using shade cloths to limit direct light, adjusting production timetables to ship plants sooner, and, in some cases, expanding production footprints for faster turnarounds).

Peanuts

In 2024, seven producers planted 2,984 acres of peanuts compared to three producers and 1,906 acres in 2023. Harvested acreage was 2,984 and 1,906 for 2024 and 2023, respectively. Yields averaged 5,254.8 pounds per acre in 2024 compared to 3,701 pounds per acre in 2023. Total production was 15,680,288 pounds with a value of \$4,718,199. Soilborne diseases (stem rot and limb rot) continue to plague peanut fields and increased input cost associated with fungicide applications.

Pecans

The 2024 pecan season marked a return to the "off" phase of the alternate bearing cycle for many orchards across Louisiana, following a strong "on" year in 2023. Total gross farm value for pecans in 2024 was estimated at \$6.98 million, a slight decrease from \$7.6 million in 2023. This included \$4.53 million from improved cultivars and \$2.45 million from native pecans.

While spring conditions were generally favorable, a late-season drought from August through October negatively impacted nut fill and kernel quality in some orchards. The cumulative stress from two prior dry years, which had boosted yields in 2022 and 2023, appears to have caught up with many trees. As a result, several cultivars — particularly Elliot in Pointe Coupee Parish — produced lower yields and smaller nuts in 2024.

Cultivars such as Candy and Summer, which had performed well during the dry years, also showed signs of fatigue, contributing to the overall decline in production. Despite these challenges, the drier weather helped suppress pecan scab, allowing some marginal cultivars to produce a crop.

Although domestic consumption and demand for pecans continue to rise, growers are facing economic pressure from cheap imports and broader market factors that are keeping wholesale prices relatively low. In 2024, wholesale prices for native pecans averaged around \$0.50 per pound, while improved cultivars ranged from \$1.00 to \$1.50 per pound, depending on variety and management practices. This is down from 2023 averages of \$0.73 per pound for native and \$1.39 per pound for improved pecans.

Retail prices, however, remained strong for producers willing to market their own product. In-shell pecans sold for \$3.00 to \$6.00 per pound for high-quality nuts, while shelled pecans ranged from \$10.00 to \$20.00 per pound, depending on local markets and packaging. This price gap continues to incentivize direct-to-consumer sales and value-added marketing strategies among small and mid-sized producers.

Looking ahead, orchard age, cultivar selection, and input management will continue to shape the viability of commercial pecan production in Louisiana.

Rice

Rice remains an extremely important crop in Louisiana agriculture, ranking among the top four in acreage and value. Approximately 461,472 acres were planted in 2024. The Rice Variety by Parish Survey conducted annually by extension agents indicated that Louisiana planted 90.5% long grain and 9.5% medium grain in 2024 compared to approximately 83% long grain, 16% medium grain in 2023.

Early predictions were that the average per acre yield for the state would be the highest ever. The cropping season started out with milder than normal temperatures in late February and early March when much of the rice in South Louisiana is planted. This early-planted rice had excellent conditions for germination and stand establishment. Unfortunately, unseasonably low temperatures in April (in the mid to upper 30s) set this early rice back, and it took the crop a long time to recover and start growing again. However, these cool conditions did not appear to have had any long-term effect on the crop. Rice producers in North Louisiana were hampered by wet conditions and then cold conditions that delayed planting. Most of the rice in North Louisiana was planted late and several thousand acres failed to be planted. Climatic conditions during the rice growing season were, for the most part, good after the early April cold spell. There was adequate but not excessive rainfall, and the rainfall events came in a timely manner in most areas. There were many days of limited cloud cover, which maximizes radiant energy. This is good for rice growth and development. Weather conditions were favorable in the first part of the harvest period, but excessive rainfall in mid-July made getting the crop out of the field a trying experience for many rice producers. Fields that were ready for harvest remained in the field as quality continued to go down. While disease pressure was low in the early season, many producers reported disease increased after these continued rains. Many people might think that rice likes rain because it is grown here as an irrigated crop. However, rice is typically negatively impacted by excessive rainfall which (because of cloud cover) decreases radiant energy to the plant. Also, very wet conditions facilitate disease development, and rain and wind can actually cause sterility in rice florets. After two to three weeks of rain, the rice harvest resumed the first part of August. Later rice saw increases in sheaf blight, kernel smut, cercospora net-blotch, cercospora panicle blight and a combination of rice stem borers, Mexican rice borers, and sugarcane borers reducing yields.

Despite the challenges with the rice crop in 2024, favorable conditions existed for the ratoon crop and resulted in higher-than-normal yields, with many reports of ratoon yields in the 20's and 30's per barrel per acre. The strong ratoon crop in 2024

helped to support the overall state average yield at 47.5 barrels per acre (7,705 pounds). This was a record increase over previous years. The better-than-expected yields were a pleasant surprise for many producers as high irrigation demand and high input prices caused production costs to increase. An increase in rice production in 2024 helped to partially offset the higher production costs and lower price.

In 2024, the statewide rice average yield was estimated at 7,705 pounds per acre (47.5 barrels or 171.2 bushels per acre), up from 7,153 pounds per acre in 2023. Nearly 35 million hundred weights of rice was produced on 453,788 harvested acres in 2024. The gross farm value in 2024 for rice produced was \$534.9 million, down from \$577.6 million in 2023. When value-added activities of \$178.1 million are considered, the total economic impact of the rice industry was estimated at \$713.1 million, down from \$769.9 million in 2023.

Sod and Turfgrass Production

During 2024, sod was produced by 12 Louisiana sod farmers on 1,942 acres compared to 14 producers farming 2,083 acres in 2023. This marks a continued decrease in the number of sod producers and sod production acreage.

Centipedegrass and St. Augustinegrass continue to make up as much as 80% of acreage in production. However, both have struggled with poor winter and transition conditions in recent years, especially St. Augustine, which many producers are now working to reestablish before selling. Hybrid bermudagrass and zoysiagrass make up the remaining acres. Demand for zoysiagrass and Tifway 419 bermudagrass increased again in 2024, as more customers view them as durable, lower-maintenance options.

Louisiana producers continue to compete with sod shipped in from out of state, specifically, southern Arkansas. Some of this out-of-state sod has raised concerns about quality. Labor also remains a serious issue across industry, with many farms struggling to find reliable help.

The gross farm value of sod and turfgrass sales in Louisiana during 2024 was estimated at \$21.6 million, compared to \$14.8 million in 2023. Value-added activities were estimated at \$16.2 million, for a total industry value of \$37.7 million in 2024, up nearly \$12 million from 2023 on stronger prices, potentially due to less supply from fewer farmers and acres in production.

Soybeans

In 2024, 1.1 million acres of soybeans were planted by 1,475 producers. A total of 1.09 million acres were harvested with an average yield of 54.3 bushels per acre. The total production for soybeans in 2024 was 59.2 million bushels. In 2024, there was an increase of 19.8 million bushels of soybeans produced compared to the 2023 cropping season. At \$11.16 per bushel, the average unit price for soybeans in 2024 decreased \$2.72 per bushel from 2023.

The 2024 planting season began strong, with 49% of the crop planted before May, exceeding the 5-year average of 37%. By the week ending June 30, planting was complete at 100%, matching the 5-year average. However, heavy statewide storms in April necessitated some replanting. Crop conditions remained favorable, with 84% rated good to excellent by the week ending Aug. 18. Subsequently, continuous rain from Aug. 28 to Sept. 11, culminating with Hurricane Francine on Sept. 11, reduced yield and seed quality in mature, unharvested soybeans, resulting in a total economic impact of \$23.7 million.

Sugarcane

In 2024, sugarcane was grown on 535,402 acres in 24 Louisiana parishes. An estimated 497,924 acres were available for harvest. The 11 raw sugar factories in the state processed 17,366,115 tons of sugarcane. The average yield of cane produced from each harvested acre was 34.9 tons/acre. The average sugar recovery at the sugar factories was 236 pounds of

sugar (96° pol) per ton of cane. The yield of commercially recoverable sugar produced per harvested acre was approximately 8,218 pounds. Total sugar production for 2024 was 2.046 million tons (96° pol).

The 2024 growing season returned to a more normal pattern following an extremely dry 2023 growing season. In 2024, there was a larger number of failed acres, mainly due to poor plantcane stands in fields planted under dry conditions. Spring months for cultivation were generally dry. Rainfall was near normal for the spring; therefore, spring cultivation, herbicide applications, and fertilization were made in a timely fashion. Sugarcane brown rust levels were low. Summer rainfall patterns were timely, and sugarcane growth was excellent.

Seedcane had sufficient height and population to provide good planting ratios. The crop remained erect until the landfall of Hurricane Francine on Sept. 11, 2024. The storm affected the southeasternmost portion of the Louisiana sugarcane industry. The Category 2 hurricane caused severe lodging, uprooting, and leaf shredding. Growers who had not finished planting did so by billet planting. Dry weather ensued helping farmers to complete planting and to start the grinding season with dry conditions. Both cane yield and sugar recovery were good, resulting in a higher-than-average yield of sugar per acre of production. Freeze events did not affect the 2024 sugarcane processing season.

Raw sugar and molasses prices were slightly lower than in 2023.

Sweet Potatoes

The 2024 Louisiana sweet potato season saw an estimated 5,532.6 acres planted across the state, predominantly in West Carroll, Franklin, Acadia, Morehouse and Avoyelles parishes. This represented a 2.5% increase in acreage from the previous season, as some new small-acreage growers entered the industry. Over 99% of the planted acres were harvested in 2024, thanks to favorable conditions during the harvest.

Yield reports for the season were mixed, likely due to varied weather conditions throughout the year. Early in the season, conditions were very wet, with much of the state receiving over nine inches of rain in May. This made planting difficult, but those who managed to establish their crops in these wet conditions reported very strong yields of high-quality sweet potatoes, thanks to the exceptional moisture available for crop establishment. However, many planting dates were pushed back into June due to the wet conditions. June brought its own challenges, with dry weather and unfavorable north winds blowing for multiple weeks. These conditions led to poor stand counts for the late plantings, resulting in suboptimal yields and poor uniformity. Overall, the combination of an exceptional early season and poor late-season yields resulted in an average yield of 481 bushels per acre, a 5% decrease from the 2023 season.

Reports indicate that storage quality for the crop was exceptional, and the price of fresh market sweet potatoes remained strong into early 2025. The farm gate value for sweet potatoes in 2024 was \$45.6 million, with \$17.1 million from processing and \$28.5 million from the fresh market. The revenue discrepancy between the processing and fresh sectors highlights the value of fresh market sweet potatoes. Moving into 2025, initial reports suggest that sweet potato acreage will align closely with that of 2024.

Vegetables, Commercial

Louisiana vegetable producers represent a diverse and industrious community. The size of farms across the state varies significantly, with both part-time and full-time growers earning sustainable incomes on farms ranging from one to several hundred acres. Most vegetable farms in Louisiana are between 5 and 10 acres in size. Smaller farms are typically family-run and operated, while larger farms often employ external H2A labor.

2024 presented some growing challenges with spring rains in the northwest part of the state delaying spring vegetable plantings. The very southern portion of the state experienced an unusually hot November. The higher than normal heat in the day and night had some disease effect on Cole crops, notably, broccoli and cauliflower with discolored heads and lots of weed growth in the fields.

Many Louisiana farms grow a variety of vegetable crops rather than specializing in just one type. Louisiana-grown vegetables are available at roadside stands, farmers' markets, Community Supported Agriculture (CSA) subscriptions, directly from farms, local grocery stores, and food banks. Additionally, many vegetable producers in Louisiana are incorporating agritourism into their operations. You-pick activities, corn mazes, and on-farm farmers' markets are becoming increasingly popular tourist attractions for residents.

In 2024, the total gross farm value of all vegetable crops in Louisiana was estimated at \$78.8 million. The top three vegetable crops in terms of gross farm value were watermelons at \$19.5 million, tomatoes at \$13.8 million, and okra at \$9.2 million.

Wheat

There were 55 producers that planted 18,665.7 acres in 2024, compared to 70 producers and 43,240 acres in 2023. Harvest conditions varied across the state, but overall conditions were good. Harvested acres were 17,922 and 42,323 for 2024 and 2023, respectively. Average yield was 54.7 bushels per acre in 2024. Total production for 2024 was 979,450 bushels compared to 2,371,939 bushels in 2023. Total crop value was \$5,210,673. Disease pressure from scab (*Fusarium* head blight) and other foliar diseases were not severe.
